

Nakul Dev — Portfolio

Style Study

nakuldev.me pairs one slab-bold variable grotesk (Degular, weights 100–900) with a near-black / near-white “graphite paper” base — never pure white or pure black. One neon accent carries the whole brand (lime **#abff2e** in dark mode, olive **#68ad00** in light), a deep violet primary sits behind it for gradients and code chrome, and everything runs inside a chrome-less frame: hidden scrollbars, a floating liquid-glass nav, Lenis-smoothed scroll, and a full-bleed animated mesh-gradient hero inset like a framed print.

- Next.js 15
- Tailwind v4
- Framer Motion
- Lenis smooth-scroll
- Degular Variable

Hero, redrawn from public/og-image.png — the live page renders this as an animated WebGL mesh gradient (wallpaper.jsx, @paper-design/shaders-react), not a static CSS gradient.

Color system

One CSS-variable token set (`app/globals.css`) redefined wholesale under `.dark`. Notice the base and accent both shift meaning between modes — light mode's accent is a muted olive (`#68ad00`), dark mode's is a full neon lime (`#abff2e`) — so the brand reads as "calm, technical" by day and "electric, screen-lit" by night on the same layout.

FOUNDATION TOKENS

--background #e0e0e0	--background #121212
--text rgb(18,18,18)	--text rgb(224,224,224)

--accent #68ad00	--accent #abff2e
--border hsla(269 48% 15% / .6)	--border hsla(269 48% 80% / .3)
--moreProjectBtn #533193	--moreProjectBtn #AA97CE

HERO MESH-GRADIENT PALETTE — WALLPAPER.JSX

The landing hero runs two stacked `<MeshGradient>` shader layers (`@paper-design/shaders-react`): a soft base and a 60%-opacity wireframe overlay in the same four colors, re-ordered. Picked live from theme.

#e0e0e0

#9880FF

#abff2e

#00A7A4

Light: base [e0e0e0, 9880FF, abff2e, 00A7A4]

#121212

#C5B8FF

#abff2e

#00D6D3

Dark: base [121212, C5B8FF, abff2e, 00D6D3]

PER-PROJECT ACCENTS — PROJECTS/DATA.JS

Each stacking project card gets its own full-bleed background color, drawn from the same violet/teal family as the hero mesh — the two colors in use today:

Spamurai · #9880FF

FindX · #00A7A4

AURORA RAMPS — GLOBALS.CSS, GRADIENT1-4

Four long hue-shifting violet gradients (`hsl 269–275°`, 25 stops each) are pre-defined per theme but not wired to a visible component in the modules read for this study — reserve them as an "available but dormant" aurora/glow layer.

One typeface, full range

Every visible word on the site is set in **Degular Variable** (`app/fonts/DegularVariable.woff2`), self-hosted via `next/font/local` with the full 100–900 weight axis exposed as one variable font — no serif, no secondary display face. Voice comes entirely from swinging that one axis from hairline to black.

TYPE SCALE — AS USED ACROSS SECTIONS

ROLE	SIZE / CLAMP	WEIGHT	USED FOR
Hero headline	clamp(1.5rem, 8vw, 5rem) · lh 1 · -0.5px tracking	900	Landing statement
Contact headline	clamp(3.2rem, 8vw, 5rem)	600	"Let's build" CTA heading
Section title	clamp(2.5rem, 5vw, 3.5rem)	800	Projects / Education / Blogs titles
About label	32px · lh 32px	900	"About Me" / accent word / muted word triad
Card number	4rem · lh 2.4rem	900	Project index "01" "02"
Card / entry title	1.5rem	700	Project name, timeline degree, blog title
Dev-stack heading	clamp(1.5rem, 4vw, 2rem)	700	"My Dev Stack"
Body copy	1rem / 16px · lh 1.5	500	Paragraphs, set in <code>--text-muted</code>
Caption	0.9rem, italic	500	Timeline dates, durations
Micro label	10–11px · uppercase · 0.12–0.18em tracking	700	Modal chrome ("RESUME", page labels)

Only one real webfont ships. The `résumé-modal chrome` (`popUp.module.css`) declares `font-family: 'Inter', system-ui, sans-serif`, but `Inter` is never loaded — no `Google-Fonts` link, no `next/font` import. In practice it silently falls back to the OS UI font, which reads as an intentional-looking "smaller, quieter, all-caps" register even though it's really just `Degular`'s fallback stepping in.

Interaction language

Nothing is a flat filled button. Every control is either a pill that *fills from a hidden dot* on hover, or a ghost link where an underline dash grows in and an arrow slides up from below — plus one floating liquid-glass capsule that holds the whole primary nav. Shown side-by-side in both themes.

TECH LABEL CHIP — PROJECTS/CARD

Node.js

■ Puppeteer

Cards & timeline

The three recurring content shapes: a bento-style project card that pins and scales as you scroll past it, a rotated-diamond timeline for education/experience, and a frosted glass card for blog posts.

PROJECT CARD — SCROLL-PINNED BENTO LAYOUT, PROJECTS/CARD

Card color is per-project (data.js); index number, title/description, Github/Live pill pair, 60/40 video + info-column split, ticker strip in the corner box.

TIMELINE — EDUCATION / EXPERIENCE, DARK

BLOG CARD — FROSTED, HOVER GLOW

border/shadow snap to --accent and the card lifts scale(1.03) on hover; translucent bg reveals whatever sits behind it.

Structure & feel

CORNER-RADIUS SCALE

CONTENT COLUMN & SECTION RHYTHM

Every section (About, Skills, Education, Blogs, Contact) locks to the same centered column — the hero and nav are the only full-bleed elements.

SHADOW TOKENS

MOTION

SCROLL ENGINE	Lenis-driven smooth scroll wraps the whole page (LenisProvider); nav links call a custom easelnOut smoothScrollTo instead of the browser default.
ENTRANCE	Nav and theme toggle slide/fade in via framer-motion's AnimatedContent — 20px travel, 1s duration, 1s delay, so chrome arrives a beat after first paint.
HOVER	Buttons and links settle on 0.25–0.5s ease-in-out for color/transform/underline — nothing snaps, nothing overshoots.
SCROLL-LINKED	Project cards pin (position: sticky) and scale down via useScroll/useTransform as the next card arrives — classic stacking-deck effect.
AMBIENT	The first timeline node pulses forever — scale 1↔1.2 with a growing accent glow, 2.5s ease loop — marking "current / in progress."
CHROME-LESS SURFACE	
SCROLLBAR	Hidden globally (scrollbar-width: none + ::-webkit-scrollbar{display:none?}) — nothing but content and the floating nav.
HERO FRAME	The mesh-gradient hero sits inset 0.75rem on every side with a 29px radius — read as a printed photo dropped onto the page, not a full-bleed banner.
RENDERING	-webkit-font-smoothing: antialiased + text-rendering: optimizeLegibility site-wide, keeping the heavy Degular weights crisp rather than fuzzy.
